

First of all, I came here because I had already experienced the benefits of hyperbaric oxygen therapy in past to prepare my body for a big surgery and then to recover more quickly. Then in 2012 when I had a double mastectomy with reconstruction for breast cancer.

Then in November 2016, I had a relapse of breast cancer, this time with brain, lung and bone metastases. I decided to resume hyperbaric sessions to keep the oxygen-bearing cells (we know that they can not survive in oxygen) and to help repair my bones.

It is known that the hyperbaric oxygen therapy aids greatly to repair fractures. In February 2017, I passed a scan that showed that all the metastases had decreased by half and that some small had completely disappeared and that cicatritiel osseal tissue was visible, all without conventional treatments and after about 40 treatments.

In November 2016 when I learned about this relapse, the treatments I was offered did not make sense. I had refused them. The doctors then gave me a life expectancy of 3 months.

So I left the hospital by ambulance because the doctors no longer wanted me to walk, for fear of breaking the bones of my hips. So the wheelchair was waiting for me at home.

One month later, at the rate of 2-3 sessions per week of hyperbaric therapies I moved with the help of a walker. Another month later without any help.

Today, 6 months later I walk every day 35 minutes after supper and I feel very good. It is therefore that I continue my treatments in hyperbaric chamber.
